## Innovative Door Lock Has Quick Code Change

The manufacturer of standalone access control systems Codelocks, has just launched the new heavy duty CL600 series of mechanical locks incorporating the new Quick Code system that allows on-door code changing in seconds.

The CL600 Quick Code systems brings significant advantages within commercial applications such as schools, hospitals and local authorities by giving greater control of coded access on multiple doors without the partial or full removal of the lock itself. The Quick Code system is available on all models in the CL600 range and uses an innovative new design to allow the keyholder to change the code using the keypad on the front of the lock.

The new range is a retrofit, reduced cost replacement for the Kaha 1000 series of mechanical locks yet with the quicker code benefit.

Each model in the range has over 8,000 possible code combinations, a key override feature as standard and locks supplied keyed alike on request giving convenient control to the keyholder. To code or uncode the lock the key must be turned anti-clockwise in the cylinder and the number buttons rotated through 180° clockwise using the code change tool to activate.
